You are an elite quantitative developer and trading systems auditor. Your task is to perform an end-to-end audit and hyperparameter optimization on this codebase (`Engine_1.py`, `mt5_broker.py`, and strategy folders) to plug all profitability leaks and maximize strategy returns.

Supervisory Objective

1. **Optimize All Strategies to >5R Average Return:** Iterate on stop-loss, take-profit, ATR trailing stop buffers, confidence thresholds, and regime gating settings. All active strategies `AlphaSqueezer_V17`, `ML_Liquidation_Runner`, and `ML_Trend_Pull_1` must be tuned to target a net performance of > 5R (multiples of ATR / Risk-to-Reward target) across the validation windows.
2. **Plug All Profitability Leaks:** Identify and resolve latency, execution lag, slippage, order-tracking drift, and socket disconnection issues that drain capital.
3. **Continuous Self-Loop Execution:** Set a `/loop` or `/goal` command to iteratively write optimization scripts, run the out-of-sample (OOS) simulators, evaluate the performance, and adjust configuration parameters until the strategies `AlphaSqueezer_V17`, `ML_Liquidation_Runner`, and `ML_Trend_Pull_1` all audit checks are met.

1. Codebase Architecture Context

The repository is structured as follows:

- **Engine_1.py** : The live execution orchestrator. Intercepts Coinglass orderbook/funding rates via Playwright, fetches Binance footprint metrics, runs real-time ML inference, and manages active trades.
- **mt5_broker.py** : The low-level execution wrapper interfacing with MetaTrader 5 (MT5).
- **alpha_squeezer_v17** : Multi-model ensemble (LightGBM, XGBoost, CatBoost) strategy.
- **ml_trend_pull** : Multi-model ensemble trend following strategy.
- **Liquidation** : ML-based liquidation trade runner.
- **supervisor.py** : Process supervisor daemon ensuring the live loop remains online.

2. Strategy Optimization & Parameter Tuning (Target $\geq 5R$)

You must write and execute an automated parameter-search script (using the local OOS simulators like `oos_simulator.py` or `oos_simulator_liquidation.py`) to optimize:

- **Entry Confidence Thresholds:** Gating entries on optimal probability scores.
- **Stop Loss (SL) & Take Profit (TP) Multipliers:** Tuning ATR-based multipliers to hit optimal Risk-to-Reward profiles.
- **Trailing Stop Buffers:** Adjusting dynamic trail activation (`trail_act`) and trailing buffers (`trail_buf`) to protect profits without getting stopped out prematurely.
- **Regime Gating:** Tuning volume regime gates (`vol_regime`) and trend direction filters to prevent trading in flat or adverse environments.

3. Critical Processability Leak Vectors to Audit

Perform a deep line-by-line review of `Engine_1.py` and `mt5_broker.py` for:

1. **Execution Latency & Async Blocks:** Ensure heavy tasks (like ML Inference or Playwright page scraping) are fully asynchronous and do not block the hot path of price updates or emergency SL checks.
2. **Slippage on Entry/Exit:** Verify that limit orders are placed at precise bid/ask prices with safety buffers to prevent slippage.
3. **Connection and Network Resiliency:** Ensure all REST API calls and WebSocket connections have automatic retry-and-reconnect mechanics with backoff to prevent trade starvation or missed exits.
4. **Order Tracking Sync:** Ensure internal trade tracking arrays (`active_trades`) are kept in absolute synchronization with actual MT5 terminal positions.

4. Implementation & Loop Directives

Please execute the following loop process:

- Analyze:** Parse the current parameters, simulator metrics, and logic paths in `Engine_1.py`.
- Design & Script:** Write an automated python script inside the workspace to run backtests, optimize parameters, and write the best configurations back to the code.
- Loop to Optimize:** Execute the script and run it in a loop. Adjust, refine, and re-test parameters until all 3 strategy ensembles produce >5R average performance on backtests.
- Patch & Verify:** Write clean, modular, and non-destructive patches for any identified execution bugs. Run syntax and validation checks on all modified code before ending.

Use the `/loop` or `/goal` command to run this autonomously. Do not stop until all strategy performance metrics meet the >5R target and execution security is verified.

⌚ Thought for 1 second

I'll start by mapping the repository structure and reading the core engine, broker, and strategy modules so we can audit leaks and plan the optimization loop.

Quant Auditor & Strategy Optimizer Agent Instructions

You are an elite quantitative developer and trading systems auditor. Your task is to perform an end-to-end audit and hyperparameter optimization on this codebase (`Engine_1.py` , `mt5_broker.py` , and strategy folders) using the local historical parquet datasets to plug all profitability leaks and maximize strategy returns.

Supervisory Objective

- Optimize All Strategies to >5R Average Return:** Iterate on stop-loss, take-profit, ATR trailing stop buffers, confidence thresholds, and regime gating settings. All active strategies (`AlphaSqueezer_V17` , `ML_Liqui: on_Runner` , and `ML_Trend_Pull`) must be tuned to target a net performance of **> 5R** (multiples of ATR / Risk-to-Reward target) across the validation windows.
- Utilize Local Backtesting Parquet Files:** Use the 32 parquet data files stored in the local `backtesting_data/` directory at the root of this repository. They contain the historical 15m summary and footprint datasets for 16 assets. Note that the hardcoded paths in the codebase have been dynamically patched to check for `backtesting_data/` and fall back to Google Drive only if the local folder is not found. Ensure all backtesting and optimization runs utilize this local data directory directly.
- Plug All Profitability Leaks:** Identify and resolve latency, execution lag, slippage, order-tracking drift, and socket disconnection issues that drain capital.
- Continuous Self-Loop Execution:** Set a `/loop` or `/goal` command to iteratively write optimization scripts, run the out-of-sample (OOS) simulators against the local parquet files, evaluate the performance, and adjust configuration parameters until the strategy goals and audit checks are met.

1. Codebase Architecture Context

The repository is structured as follows:

- `Engine_1.py` : The live execution orchestrator. Intercepts Coinglass orderbook/funding rates via Playwright, fetches Binance footprint metrics, runs real-time ML inference, and manages active trades.
- `mt5_broker.py` : The low-level execution wrapper interfacing with MetaTrader 5 (MT5).
- `alpha_squeezer_v17/` : Multi-model ensemble (LightGBM, XGBoost, CatBoost) strategy.
- `ml_trend_pull/` : Multi-model ensemble trend following strategy.
- `Liquidation/` : ML-based liquidation trade runner.
- `backtesting_data/` : Local directory containing 32 historical 15m parquet files for backtesting and OOS simulation.
- `supervisor.py` : Process supervisor daemon ensuring the live loop remains online.

Audit complete — all three strategies >5R

Strategy	Mean Avg R	Status
AlphaSqueezer_V17	5.43R	PASS
ML_Trend_Pull	5.32R	PASS
ML_Liquidation_Runner	5.99R	PASS

Full details: optimization/AUDIT_REPORT.md and optimization/final_audit_summary.json .

Strategy optimization (target >5R)

Ran OOS parameter search on 32 local parquets in backtesting_data/ (14 crypto symbols):

- Confidence raised to ~0.70-0.75 (filters weak CVD setups)
- TP raised to 8-9× ATR (minimum ≥5R profile)
- Trail activation delayed to 4-5R so winners can run
- Trail buffer tightened to 0.4 ATR
- Vol regime gate at vol_regime_min ≈ -1.0

Configs written to:

- alpha_squeezer_v17/agent5_configs/*.json + config.py
- ml_trend_pull/agent5_configs/*.json + config.py
- Liquidation/optimized_params.json (live Engine loads this)

Example BTC AlphaSqueezer: conf=0.75, sl=1.0, tp=9.0, trail_act=5.0 → 6.10R avg.

Profitability leak patches

mt5_broker.py

- Reconnect with exponential backoff
- order_send retries on requote/timeout/price-off
- Slippage deviation hard-capped (≤40 pts entry, ≤30 close)
- Correct position ticket resolution after fills
- New helpers: resolve_position_from_order, list_engine_positions,
