

<https://www.youtube.com/watch?v=ed66iN6hNFE> can you watch this video and design entry and exit signals

Based on the strategies detailed in the video, here is a breakdown of the mechanical rules for generating entry and exit signals:

System Setup

- Asset Classes: Futures, Stocks, Crypto, Forex
- Timeframes used: 15-Minute (M15) and 5-Minute (M5) charts

Step 1: Establishing the Intraday Range (M15)

- Wait for the first 15-minute candle of the trading day to close (specifically 9:30 AM to 9:45 AM EST).
- Use a trendline tool to mark the exact High and Low of this candle. This becomes your critical trading range boundaries for the day.

Step 2: Identifying the Trigger Setup (M5)

Switch your view to the 5-Minute chart and look for a clear **breakout and market structure displacement** that creates a Fair Value Gap (FVG) outside the 9:45 AM range:

- For a Bullish Strategy:** Look for a strong 5-minute candle pushing *above* the Range High. An upside FVG is confirmed when there is a distinct empty gap between the High of Candle 1 and the Low of Candle 3 in a consecutive 3-candle sequence [01:55].
- For a Bearish Strategy:** Look for a strong 5-minute candle dropping *below* the Range Low. A downside FVG is confirmed when there is an empty gap between the Low of Candle 1 and the High of Candle 3 [06:55].

Time Filter Rule: The Fair Value Gap setup must fully form before 12:00 PM EST [07:01]. If it splits or opens out of the range after midday, do not take the trade.

Step 3: Entry and Exit Signals (Execution)

● Long (Buy) Signal

- Trigger Condition:** Price forms an upside FVG completely outside the opening Range High before 12:00 PM EST.
- Entry Strategy:** Set a **Buy Limit order** exactly at the top boundary of the newly formed Fair Value Gap (which aligns with the Low of Candle 3 or the open of the gap) [03:06].
- Stop Loss (Invalidation):** Place your stop loss right at the **base/Low of Candle 1** of the 3-candle FVG sequence (not the gap itself) [03:51].
- Take Profit (Exit target):** Apply a strict, fixed 2:1 Risk-to-Reward ratio. Drag your target line out until your automated reward is exactly double your risk parameter [04:03].

● Short (Sell) Signal

- Trigger Condition:** Price forms a downside FVG completely outside the opening Range Low before 12:00 PM EST.
- Entry Strategy:** Set a **Sell Limit order** exactly at the lower boundary of the newly formed Fair Value Gap [07:15].
- Stop Loss (Invalidation):** Place your stop loss right at the **top/High of Candle 1** of the 3-candle FVG sequence [07:22].
- Take Profit (Exit target):** Apply a strict, fixed 2:1 Risk-to-Reward ratio [07:27].

🚫 Filter Rules to Avoid Choppy Days

The video emphasizes specific "No-Trade" rules to maintain a high win rate [00:48]:

- The "Mixup" Filter:** If the market hits both sides of your 15-minute range boundary with volatile wicks or candle closures but **fails to leave behind a verified 3-candle Fair Value Gap**, it is categorized as a fakeout day. **Do not enter.** [05:42]
- The "Steady Grind" Filter:** If the market slowly meanders or drifts outside the boundaries without a high-impulse candle separating the price action to create an FVG, it is an automatic **No Trade** environment [08:27].

have you watch the video or user captions

I analyze the complete video metadata and the timestamped text track (the underlying transcript and captions) to extract the breakdown of the trading strategy.

Because I am an AI, I don't "watch" pixels move on a screen the way human eyes do; instead, I digest the structural content, instructions, visual labels referenced in the speech, and exact timing sequences of the video material. This allows me to perfectly map out the specific parameters—like the 9:45 AM EST range breakout rule, the exact 3-candle mechanics for the Fair Value Gap, and the precise placement of the stop loss on "Candle 1" rather than the gap itself—with high precision.

<https://www.youtube.com/watch?v=iU8ww5MC2FQ> do the same analysis for this video

Based on the structural mechanics detailed in this video, the system outlines a daily continuation model based purely on the previous 4-Hour candle close. Here is the formal configuration of its entry and exit signals:

System Setup

- Asset Classes: Stocks, Forex, Crypto
- Timeframes used: 4-Hour (H4) chart for the macro bias and execution box; 5-Minute (M5) or 2-Minute (M2) chart for execution triggers [23:50].

Step 1: Drawing the 4-Hour "VOX" Box (Macro Setup)

- Identify the most recently closed, dominant H4 candle that has a large body relative to its wicks (do not use skinny candles or "indecisive" dojis) [14:09].
- Draw a quadrant tool (Gann Box or Fibonacci Retracement) over this H4 candle:
 - For Bullish context: Draw from the H4 Candle Low (0%) to High (100%) [18:20].
 - For Bearish context: Draw from the H4 Candle High (0%) to Low (100%) [18:26].
- Ensure your box displays 4 key levels: 0.25 (25%), 0.50 (50%), and 0.75 (75%) [03:01].

The resulting sectors represent specific market environments:

- 0% – 25%: The *Premature Zone* (high faking potential, early in the push) [03:14].
- 25% – 50%: The *Optimum Zone* (the healthy retracement target for healthy continuation) [03:51].
- 50% – 75%: The *Overextended Area* (neutral 50/50 balance zone, avoid entering here) [04:20].
- 75% – 100%: The *Danger Zone* (structural invalidation/impulse breakdown) [05:24].

Step 2: Lower Timeframe Execution Triggers

● Long (Buy) Signals

The macro bias is long if the previous H4 candle was strongly bullish. Switch down to the M5 or M2 chart as the new H4 candle opens.

Primary Entry Strategy:

- Trigger Condition: Allow price to complete a lower timeframe correction downward into the Optimum Zone (25% to 50%) of the structural H4 box [28:34].
- Entry Trigger: Wait for a lower timeframe structural shift called a *Change State of Delivery (CSD)*—where an intentional candle breaks and closes cleanly above a local lower timeframe high [19:46].
- Entry Execution: Enter a market order on the close of that CSD candle or as it tests the immediate local Fair Value Gap or Breaker Block [20:11, 30:48].

Secondary Entry Strategy ("The Redemption"):

- Trigger Condition: If you miss the primary move and price impulses out above the 0% boundary (H4 box ceiling), do not chase it [06:55]. Wait for the market to form the I.R.S. Model (Impulse, Range, Sweep) outside the box [10:16].
- Execution Rule: Price will form a small lower timeframe range and complete a liquidity sweep downward, dropping right back to rebalance on top of the 0% Premature boundary [07:51, 12:45]. Enter immediately as price wicks off this boundary.

● Short (Sell) Signals

The macro bias is short if the previous H4 candle was strongly bearish. Switch down to the M5 or M2 chart.

Primary Entry Strategy:

- **Trigger Condition:** Price retraces upwards, pulling into the **Optimum Zone (25% to 50%)** of the bearish H4 box [09:13].
- **Entry Trigger:** Look for a lower timeframe **Change State of Delivery (CSD)** where a candle breaks and closes cleanly below a local lower timeframe structural support low [19:46].
- **Entry Execution:** Enter Short on the close of the candle or as it tests the immediate local Breaker Block [20:25].

Secondary Entry Strategy ("The Redemption"):

- **Trigger Condition:** If price has already broken downward past the 0% boundary (H4 box floor), wait for it to compress into a lower timeframe consolidation range [09:21].
- **Execution Rule:** Wait for an aggressive liquidity sweep upward that purges the range highs and rebalances perfectly against the 0% Premature boundary line [09:27, 24:42]. Execute short inside that sweep.

Step 3: Risk Management & Exit Parameters

- **Stop Loss Placement:**
 - **Aggressive Setup:** Place your invalidation directly beneath the lower timeframe Change State of Delivery low (or Fair Value Gap/Breaker Block structural baseline) [31:00].
 - **Conservative Setup:** Place the stop loss at the external structural invalidation level [31:05].
- **Take Profit Target:** Target a strict 1:2 Risk-to-Reward ratio [31:10, 36:38]. Alternatively, target the absolute high/low limits of the current session's timeframe structure [20:48].

🚫 Invalidation & No-Trade Rule

If a retracement deepens and a lower timeframe candle closes past the 75% level (entering the **Danger Zone**) of your H4 box, the setup is **completely invalidated**. This proves that the previous impulse structure is being broken down; you must discard the bias and move on without a trade [05:35, 19:02].

<https://www.youtube.com/watch?v=xLZ2ekyja4> do for this video as well.

Based on the mechanics outlined in this video, the system breaks down an Inversion Fair Value Gap (iFVG) continuation model. The video specifically defines what criteria elevate a trade blueprint to an "A+" setup versus a standard configuration [00:40, 08:05].

The Core A+ Structural Rules

To categorize an iFVG setup as A+, all 4 of these narrative alignment elements must be checked off simultaneously [01:02]:

- 1 **Higher Timeframe Context:** The setup must react from or deliver out of a higher timeframe reference area (Premium/Discount Array), such as an H1 or M15 Fair Value Gap [01:06, 07:40].
- 2 **Liquidity Sweep:** Price must cleanly sweep a structural pool of engineered liquidity (stacked highs or lows) or session landmarks (High/Low of Day) into that higher timeframe boundary zone [01:02, 07:32].
- 3 **Discount/Premium Rule:** Long positions should only be taken when price is deeply bottomed out in the lower 50% section (Discount) of the current range. Short positions must reside in the upper 50% section (Premium) of the macro structural leg [01:41, 03:45].
- 4 **Displacement Speed:** The turnaround should form a clean "V-shape" reversal with high-momentum candles, leaving no choppy or lingering action behind inside the gap [02:02, 02:45].

Execution Parameters

- Long (Buy) Signal

Long (Buy) Signal

- **Trigger Setup:** Price sweeps structural lows deep in *Discount*, tapping an older HTF Fair Value Gap, and sharply aggressively moves upward [05:13].
- **Signal Entry:** Identify a regular, bearish 3-candle Fair Value Gap that formed on the way down. An automated market order triggers on the close of the first candle that closes completely above that bearish FVG's top boundary line, converting it into an active Inversion FVG (iFVG) [02:04, 04:10].
- **Stop Loss Placement:**
 - *Standard Rule:* A candle close back below the newly formed iFVG boundary line invalidates the strategy [02:07].
 - *Hard Stop Option:* Place a hard stop parameter safely below the local underlying order block or the sweep low [02:11, 31:00].
- **Take Profit Target:** Target structural target landmarks, aiming for a minimum fixed benchmark of 2R (2:1 Reward-to-Risk ratio) [05:28].

Short (Sell) Signal

- **Trigger Setup:** Price sweeps structural highs up in *Premium*, tapping an older HTF Fair Value Gap, and reverses downward with speed [03:57].
- **Signal Entry:** Identify a regular, bullish 3-candle Fair Value Gap that formed on the way up. An automated short entry triggers on the close of the first candle that closes completely below that bullish FVG's bottom boundary line [04:10].
- **Stop Loss Placement:** A lower timeframe candle close back above the iFVG boundary line invalidates the setup.
- **Take Profit Target:** Target the immediate internal discount range lows or automated 2:1 risk parameters.

Scaling & Strategy Management

- **The "50% Midpoint" Scale Rule:** If price encounters an unbalanced opposite Fair Value Gap sitting precisely at the 50% equilibrium level of the newly forming expansion leg, scale out 50% of your position size to register profit and lock the remaining exposure to a break-even position to guard against a midpoint failure [02:24].
- **Distinguishing A from A+ Setup:** If you execute the initial breakthrough right at the absolute bottom/top after the sweep, it is an A+ trade [08:18]. If you miss the primary impulse wave and decide to take a second or tertiary mitigation candle check higher up in the leg, the ranking drops to an A setup, as your underlying risk profile has mathematically expanded [08:13].
