Antigravity Skill Vault

A curated collection of Agent Skills for Google Antigravity, ported from the [Claude Code Agents](#) repository.

This vault transforms the extensive Claude Code ecosystem into **Antigravity Skills**, providing your agent with repeatable workflows, domain expertise, and specialized tools.

Overview

This repository contains **300+** specialized skills across software development, operations, security, and business domains. Each skill is a directory-based package that teaches Antigravity's agent how to perform specific tasks.

What's Included?

The skills are derived from three types of Claude Code components, all unified into the Antigravity Skill format:

- Domain Skills** (e.g., `k8s-manifest-generator`, `async-python-patterns`): Specialized knowledge packages.
- Specialist Agents** (e.g., `backend-architect`, `security-auditor`): Persona-based instruction sets for complex reasoning.
- Commands & Workflows** (e.g., `full-stack-orchestration-full-stack-feature`, `conductor-implement`): Structured, multi-step procedures.

Categories

Skills are flattened in the `skills/` directory, but cover these broad categories:

 **Development & Languages**

- Python:** `python-pro`, `fastapi-pro`, `async-python-patterns`, `uv-package-manager`
- JavaScript/TypeScript:** `typescript-pro`, `react-modernization`, `nextjs-app-router-patterns`
- Systems:** `rust-pro`, `golang-pro`, `memory-safety-patterns`
- Mobile:** `frontend-mobile-development-component-scaffold`, `react-native-architecture`

 **Infrastructure & Operations**

- Kubernetes:** `kubernetes-architect`, `helm-chart-scaffolding`, `gitops-workflow`
- Cloud:** `cloud-architect`, `terraform-module-library`, `cost-optimization`

About

A curated collection of Agent Skills for
Google Antigravity

github.com/rmyndharis/antigravity-s...

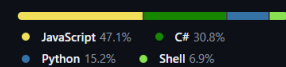

Releases

Packages

Contributors 2

 **rmyndharis** Yudhi Armyndharis
 **csiprivate**

Languages

- **CI/CD:** `cicd-automation-workflow-automate`, `github-actions-templates`, `gitlab-ci-patterns`

🔒 Security & Quality

- **Security:** `security-auditor`, `sast-configuration`, `security-scanning-security-hardening`
- **Code Quality:** `code-review-ai-ai-review`, `code-refactoring-refactor-clean`, `codebase-cleanup-tech-debt`
- **Testing:** `unit-testing-test-generate`, `tdd-workflows-tdd-cycle`, `e2e-testing-patterns`

🔧 Workflows & Architecture

- **Conductor:** `conductor-implement`, `context-driven-development` (Context-Driven Development)
- **Architecture:** `c4-architecture-c4-architecture`, `microservices-patterns`, `api-design-principles`
- **Orchestration:** `full-stack-orchestration-full-stack-feature`, `incident-response-incident-response`

📊 Data & AI

- **Data Engineering:** `data-engineer`, `spark-optimization`, `dbt-transformation-patterns`
- **AI/ML:** `ml-pipeline-workflow`, `prompt-engineering-patterns`, `rag-implementation`

🚀 Install Strategically (Token Efficient)

Antigravity loads metadata (name + description) from every installed skill at session start. More skills means more token usage and a higher chance of irrelevant auto-activation. Prefer targeted installs via search, tags, or bundles. `install --all` is advanced and not recommended for most projects.

📖 Catalog & Discovery

This repo ships a generated catalog for discovery:

- `CATALOG.md` (human-readable index)
- `catalog.json` (machine-readable index used by the CLI)
- `bundles.json` (curated bundles)
- `aliases.json` (short names that map to long skill IDs)

Regenerate after adding/editing skills:

```
npm run build:catalog
```

🔧 How to Use

When a conversation starts, Antigravity loads the **metadata** (name & description) from all skills. ANTIGRAVITY automatically activates a skill when your request matches its description.

Examples:

- "Help me design a REST API for a user service" → Activates `api-design-principles` and `backend-architect`.
- "Scaffold a new FastAPI project" → Activates `python-development-python-scaffold`.
- "Review this PR for security issues" → Activates `security-scanning-security-hardening` OR `security-auditor`.
- "Start a new feature track for login" → Activates `conductor-new-track`.

You can install skills in **two** scopes:

- **Workspace scope** (project-specific): `<workspace-root>/ .agent/skills/`
- **Global scope** (available in all projects): `~/.gemini/antigravity/skills/`

Using `npx` (Recommended)

You can easily install skills directly from the repository without cloning it manually.

1. Search skills (recommended first):

```
npx @rmyndharis/antigravity-skills search <query>
# Example:
npx @rmyndharis/antigravity-skills search kubernetes
```

2. List available skills:

```
npx @rmyndharis/antigravity-skills list
```

3. Install a specific skill to your current project:

```
npx @rmyndharis/antigravity-skills install <skill-name>
# Example:
npx @rmyndharis/antigravity-skills install bash-pro
```

4. Install by tag or bundle (targeted sets):

```
# By tag
npx @rmyndharis/antigravity-skills install --tag kubernetes
```

```
# By bundle
npx @rmyndharis/antigravity-skills install --bundle core-dev
```

Available bundles: `core-dev`, `security-core`, `k8s-core`, `data-core`, `ops-core`.

5. Install a skill globally:

```
npx @rmyndharis/antigravity-skills install <skill-name> --global
# Example:
npx @rmyndharis/antigravity-skills install bash-pro --global
```

6. Check installed skills:

```
# List local specific skills
npx @rmyndharis/antigravity-skills installed

# List globally installed skills
npx @rmyndharis/antigravity-skills installed --global
```

7. Update installed skills:

```
# Update a specific skill
npx @rmyndharis/antigravity-skills update <skill-name>

# Update ALL installed skills
npx @rmyndharis/antigravity-skills update

# Update global skills
npx @rmyndharis/antigravity-skills update --global
```

8. Doctor / stats:

```
npx @rmyndharis/antigravity-skills doctor
npx @rmyndharis/antigravity-skills stats
```

9. Install ALL skills (advanced, not recommended):

```
# To your current workspace
npx @rmyndharis/antigravity-skills install --all

# Globally
npx @rmyndharis/antigravity-skills install --all --global
```

Note: Installing all skills increases token usage and can trigger unrelated skills. Prefer targeted installs.

Aliases are supported via `aliases.json` (for long skill names).

Example:

```
npx @rmyndharis/antigravity-skills install full-stack-feature
```

Manual Installation

If you prefer to clone the repository:

Option A — Install to a workspace

```
mkdir -p .agent/skills
cp -R /path/to/antigravity-skills/skills/<skill-name> .agent/skills/
```

Option B — Install globally

```
mkdir -p ~/.gemini/antigravity/skills
cp -R /path/to/antigravity-skills/skills/<skill-name> ~/.gemini/antigravity/skills/
```

Note: After copying skills, restart your agent session so Antigravity re-detects them.

+ Adding New Skills

1. Create a folder: `skills/<skill-name>/`
2. Add `SKILL.md` (required)
3. (Optional) Add helpers: `scripts/`, `references/`, `assets/`

Authoring Guidelines

- Keep `SKILL.md` concise; move long examples to `resources/` or `examples/`.
- Use narrow descriptions (for example: "Use when you need to ...") and include "Do not use" to reduce over-activation.
- Add a "Safety" section for skills that propose terminal or infrastructure changes.
- Regenerate catalog files with `npm run build:catalog` and validate with `npm run validate:skills`.
- CI runs strict validation using `validation-baseline.json` for existing gaps; new skills must include the required sections.
- If you backfill existing skills, refresh the baseline with `node scripts/validate-skills.js --write-baseline`.

SKILL.md Template

```
---
name: <skill-name>
description: <one sentence describing when to use this skill>
---

# <Skill Title>

## Use this skill when
- ...

## Do not use this skill when
- ...

## Instructions
1. ...
2. ...
```

Security

See [SECURITY.md](#) for safety expectations when writing skills that touch terminals or infrastructure.
