Antigravity Awesome Skills is an installable GitHub library and npm installer for reusable SKILL.md playbooks. It is designed for Claude Code, Cursor, Codex CLI, Gemini CLI, Antigravity, Kiro, OpenCode, GitHub Copilot, and other AI coding assistants that benefit from structured operating instructions. Instead of collecting one-off prompt snippets, this repository gives you a searchable, installable catalog of skills, bundles, workflows, plugin-safe distributions, and practical docs that help agents perform recurring tasks with better context, stronger constraints, and clearer outputs.

You can use this repo to install a broad multi-tool skill library, start from focused plugin bundles, or jump into workflow-driven execution for planning, coding, debugging, testing, security review, infrastructure, product work, and growth tasks. The root README is intentionally a high-signal landing page: understand what the project is, install the right surface quickly, choose the right tool path, and then follow deeper docs only when you need them.

The canonical project page is the GitHub repository at <https://github.com/sickn33/antigravity-awesome-skills>; the hosted catalog is a companion discovery surface for search, plugins, and skill detail pages.

Current release: V12.4.0. Trusted by 40k+ GitHub stargazers, this repository combines official and community skill collections with bundles, workflows, installation paths, and docs that help you go from first install to daily use quickly.

Why This Repo

- **Installable, not just inspirational:** use `npx antigravity-awesome-skills` to put skills where your tool expects them.
- **Built for major agent workflows:** Claude Code, Cursor, Codex CLI, Gemini CLI, Antigravity, Kiro, OpenCode, Copilot, and more.
- **Broad coverage with real utility:** 1,541+ skills across development, testing, security, infrastructure, product, and marketing.
- **Focused by default:** specialized plugins help you start with the web, security, data, docs, DevOps, QA, OSS, or agent/MCP workflows you actually need.
- **Useful whether you want breadth or curation:** install the full catalog, choose a specialized plugin, start with bundles, or compare alternatives before installing.

Installation

Most users should start by choosing the smallest useful surface:

- **Specialized plugins** when the job has a clear domain.
- **Full library install** when you want every skill available in a local skills directory.
- **Bundles and workflows** when you want role-based recommendations or ordered execution playbooks.

Full library install

```
# Default: ~/.agents/skills (Antigravity 2.0 global). Use --path for other locations.
npx antigravity-awesome-skills

# Antigravity CLI slash commands (agy): ~/.gemini/antigravity-cli/skills/<skill>/SKILL.md
npx antigravity-awesome-skills --agy
```

The npm installer uses a shallow, release-pinned clone by default so first-run installs stay lighter than a full repository history checkout while matching the published npm package version. Use `--tag main` only when you intentionally want the current repository tip.

Verify the install

```
test -d ~/.agents/skills && echo "Skills installed in ~/.agents/skills"
```

Run your first skill

Use @brainstorming to plan a SaaS MVP.

Prefer plugins for Claude Code or Codex?

- Use a specialized plugin when you want a focused marketplace-style distribution.
- Use the full-library plugin only when you want the widest plugin-safe catalog.
- Read [Plugins for Claude Code and Codex](#) for full-library plugin install vs specialized plugin install vs direct skills install.

Recommended Specialized Plugins

Do not install everything first if you already know the work. Start with the focused plugin for your job, then add more only when the task expands.

All specialized plugins are generated as Claude Code and Codex plugin bundles. For Antigravity, use the same `SKILL.md` content through the installer or supported skills paths.

Plugin	Skills	Best for
AAS Web App Builder	9	Frontend and full-stack developers shipping modern web apps.
AAS Product Design Studio	8	Product UI, brand, portfolio, and richer visual work.
AAS Security Engineer	9	Authorized security testing, audit, and hardening.
AAS Secure App Builder	8	Developers who want security embedded while building features.
AAS Documents & Presentations	8	Office files, document conversion, decks, and slide workflows.
AAS Data Analytics	8	Product analytics, SQL, dashboards, and experiments.
AAS Agent & MCP Builder	9	Agentic apps, MCP tools, RAG systems, and evaluation loops.
AAS OSS Maintainer	10	PRs, releases, reviews, and contributor handoffs.
AAS QA & Test Automation	9	Test suites, browser automation, and QA stabilization.
AAS DevOps & Cloud	9	Infrastructure, deployments, and operational workflows.

Next-wave plugins cover marketing/SEO/growth, automation, observability/incident response, Python APIs, and mobile apps.

- Read the [specialized plugin roadmap](#).
- Read the [plugin guide for Claude Code and Codex](#).
- Compare the hosted [specialized plugin landing page](#).
- Browse the generated plugin folders in [plugins/](#).

Choose Your Tool

Use the same repository, but install or invoke it in the way your host expects.

Tool	Install	First Use
Claude Code	<code>npx antigravity-awesome-skills --claude</code> or Claude plugin marketplace	<code>>> /brainstorming help me plan a feature</code>
Cursor	<code>npx antigravity-awesome-skills --cursor</code>	<code>@brainstorming help me plan a feature</code>
Gemini CLI	<code>npx antigravity-awesome-skills --gemini</code>	Use <code>brainstorming</code> to plan a feature
Codex CLI	<code>npx antigravity-awesome-skills --codex</code>	Use <code>brainstorming</code> to plan a feature
Antigravity IDE	<code>npx antigravity-awesome-skills --antigravity</code>	Use <code>@brainstorming</code> to plan a feature
Antigravity CLI (agy)	<code>npx antigravity-awesome-skills --agy</code>	<code>/brainstorming help me plan a feature</code>
Kiro CLI	<code>npx antigravity-awesome-skills --kiro</code>	Use <code>brainstorming</code> to plan a feature
Kiro IDE	<code>npx antigravity-awesome-skills --path ~/.kiro/skills</code>	Use <code>@brainstorming</code> to plan a feature
GitHub Copilot	<i>No installer — paste skills or rules manually</i>	Ask Copilot to use <code>brainstorming</code> to plan a feature
OpenCode	<code>npx antigravity-awesome-skills --path .agents/skills -category development,backend --risk safe,none</code>	<code>opencode run @brainstorming help me plan a feature</code>
Adal CLI	<code>npx antigravity-awesome-skills --path .adal/skills</code>	Use <code>brainstorming</code> to plan a feature
Custom path	<code>npx antigravity-awesome-skills --path ./my-skills</code>	Depends on your tool

Use the table above for install targets. Use specialized plugins when you are choosing what to install for a domain, then use the host guides below only for path details, prompt examples, and setup caveats.

- [Claude Code skills](#): install paths, starter skills, prompt examples, and plugin marketplace flow.
- [Cursor skills](#): `.cursor/skills/` setup, UI-heavy work, and pair-programming flows.
- [Codex CLI skills](#): planning, implementation, debugging, and review skills for local coding loops.
- [Gemini CLI skills](#): research, agent systems, integrations, and engineering workflows.
- [AI agent skills guide](#): breadth vs curation, skill-library evaluation, and starting-point selection.

Quick FAQ

What is Antigravity Awesome Skills?

Antigravity Awesome Skills (Release 12.4.0) is a large, installable skill library for AI coding assistants. It packages 1,541+ reusable `SKILL.md` playbooks, specialized plugins, bundles, workflows, generated catalogs, and a CLI installer so Claude Code, Codex CLI, Cursor, Gemini CLI, Antigravity, and similar tools can reuse proven operating instructions instead of one-off prompts.

How do I install it?

Run `npx antigravity-awesome-skills` for the default full-library install. Use a tool-specific flag such as `--codex`, `--cursor`, `--gemini`, `--claude`, or `--antigravity` when you want the installer to place skills in the directory your assistant already watches.

What are AAS specialized plugins?

AAS specialized plugins are focused, domain-specific distributions of the skill library. They package the most relevant skills for web apps, security, data analytics, documents, DevOps, QA, OSS maintenance, and agent or MCP work so users can start with the right surface instead of activating the entire catalog.

Should I use the full library or a plugin?

Use the full library if you want the biggest catalog and direct filesystem control. Use a specialized plugin when you want a smaller, marketplace-style distribution for a specific workflow in Claude Code or Codex. For Antigravity, install the matching skills into the supported skills path. The complete explanation lives in [Plugins for Claude Code and Codex](#).

How are plugins, bundles, and workflows different?

Plugins are installable packaging surfaces, bundles are curated skill recommendations, and workflows are ordered execution playbooks. Start with a plugin when the domain is clear, use bundles to compare adjacent skills, and use workflows when the important part is sequencing planning, coding, testing, auditing, or release work.

Where do I browse plugins, bundles, workflows, and the full catalog?

Start with [Specialized Plugins](#) when you want an installable domain pack. Use [Bundles](#) for role-based recommendations, [Workflows](#) for ordered execution playbooks, [CATALOG.md](#) for the full registry, and the hosted [GitHub Pages catalog](#) for searchable browsing.

Bundles & Workflows

Plugins, bundles, and workflows answer different questions. Plugins are the installable packaging surface; bundles are curated recommendations; workflows are ordered playbooks for getting a result.

Surface	Answers	Use it for
Specialized plugin	What should I install or activate for this domain?	Focused Claude Code/Codex plugin packaging and Antigravity-compatible skill selection.
Bundle	Which skills naturally belong together?	Role-based discovery after a full-library install or when building a custom subset.
Workflow	What order should the agent run skills in?	Planning, shipping, auditing, testing, or incident-style execution.

Use a specialized plugin first when your domain is clear. Use bundles to explore adjacent skills or assemble a custom install. Use workflows when the hard part is sequencing the work.

Start with bundles

Bundles are curated groups of recommended skills for a role or goal such as `Web Wizard`, `Security Engineer`, or `OSS Maintainer`.

- Bundles are recommendations, not separate installs.
- Install the closest specialized plugin when one matches your work, or install the repository once and use [docs/users/bundles.md](#) to pick a starting set.
- Good starter combinations:
 - SaaS MVP: `Essentials` + `Full-Stack Developer` + `QA & Testing`
 - Production hardening: `Security Developer` + `DevOps & Cloud` + `Observability & Monitoring`
 - OSS shipping: `Essentials` + `OSS Maintainer`

Use workflows for outcome-driven execution

- Read [docs/users/workflows.md](#) for human-readable playbooks.
- Use [data/workflows.json](#) for machine-readable workflow metadata.
- Initial workflows include shipping a SaaS MVP, security audits, AI agent systems, QA/browser automation, and DDD-oriented design work.

Need fewer active skills at runtime?

Need fewer active skills at runtime:

If Antigravity starts hitting context limits with too many active skills, the activation guidance in [docs/users/agent-overload-recovery.md](#) can materialize only the bundles or skill ids you want in the live Antigravity directory.

If you use OpenCode or another `.agents/skills` host, prefer a reduced install up front instead of copying the full library into a context-sensitive runtime. The installer now supports `--risk`, `--category`, and `--tags` so you can keep the installed set narrow.

Browse 1,541+ Skills

Use the root repo as a landing page, then jump into the deeper surface that matches your intent.

What you get in this repository

- Skills library in [skills/](#)
- Installer CLI powered by the npm package in [package.json](#)
- Generated catalog and metadata in [CATALOG.md](#), [skills_index.json](#), and [data/](#)
- Hosted and local web app in [apps/web-app](#) and on [GitHub Pages](#)
- Role-based bundles in [docs/users/bundles.md](#)
- Specialized plugin surfaces in [docs/users/specialized-plugin-roadmap.md](#), [docs/users/plugins.md](#), and [plugins/](#)
- Execution workflows in [docs/users/workflows.md](#)
- User, contributor, and maintainer docs under [docs/](#)
- Project visuals in [assets/](#), including the [hero](#), [social card](#), [logo](#), and [support banner](#)

Best ways to explore

- Read the full catalog in [CATALOG.md](#).
- Browse the hosted catalog at <https://sickn33.github.io/antigravity-awesome-skills/>.
- Start with [Getting Started](#) and [Usage](#) if you are new after installation.
- Use [Bundles](#) for role-based discovery and [Workflows](#) for step-by-step execution.
- Use [Plugins for Claude Code and Codex](#) when you care about marketplace-safe distribution, and the [Specialized Plugin Roadmap](#) when you want the best plugin candidates.

Compare alternatives

- [Antigravity Awesome Skills vs Awesome Claude Skills](#) for breadth vs curated-list tradeoffs.
- [Best Claude Code skills on GitHub](#) for a high-intent shortlist.
- [Best Cursor skills on GitHub](#) for Cursor-compatible options and selection criteria.

Troubleshooting

Keep the root README short; use the dedicated docs for recovery and platform-specific guidance.

- If you are confused after installation, start with the [Usage Guide](#).
- If you integrate antigravity-awesome-skills into a host, read the discovery contract first: [Stable Skills Manifest v1](#).
- For Windows truncation or context crash loops, use [docs/users/windows-truncation-recovery.md](#).
- For Linux/macOS overload or selective activation, use [docs/users/agent-overload-recovery.md](#).
- For OpenCode or other `.agents/skills` installs, prefer a reduced install such as `npx antigravity-awesome-skills --path .agents/skills --category development,backend --risk safe,none`.
- For plugin install details, host compatibility, and marketplace-safe distribution, use [docs/users/plugins.md](#).
- For contributor expectations and guardrails, use [CONTRIBUTING.md](#), [CODE_OF_CONDUCT.md](#), and [SECURITY.md](#).

Stable Skills Manifest v1

Host integrations should use:

- [skills_index.json](#) as the canonical array-format manifest.
- [schemas/skills_index.v1.schema.json](#) for the JSON shape.
- [data/skills_index.json](#) as the compatibility mirror.

This keeps discovery stable (`id`, `path`, metadata) while ensuring hosts only load `SKILL.md` for requested `@skill-id` values.

Support the Project

Support is optional. The project stays free and open-source for everyone.

- [Buy me a book on Buy Me a Coffee](#)
- [Star the repository](#)
- [Open reproducible issues](#)

- Contribute docs, fixes, and skills

Contributing

- Add new skills under `skills/<skill-name>/SKILL.md`.
- Follow the contributor guide in `CONTRIBUTING.md`.
- Use the template in `docs/contributors/skill-template.md`.
- Validate with `npm run validate` before opening a PR.
- Keep community PRs source-only; do not commit generated registry artifacts like `CATALOG.md`, `skills_index.json`, or `data/*.json`.
- If your PR changes `SKILL.md`, expect the automated `skill-review` check on GitHub in addition to the usual validation and security scans.
- If your PR changes skills or risky guidance, manual logic review is still required even when the automated checks are green.

Community

- [Discussions](#) for questions, ideas, showcase posts, and community feedback.
- [Issues](#) for reproducible bugs and concrete, actionable improvement requests.
- Follow [@AASkills](#) on X for daily skills, practical workflows, and example prompts from the repo.
- Follow [@sickn33](#) on X for project updates and releases.
- [CODE_OF_CONDUCT.md](#) for community expectations and moderation standards.
- [SECURITY.md](#) for security reporting.
