Strategy Overview

01 – Daily + 4HTF

02 – 15 min LTF

03 – PDH & PDL

04 – FVG

05 – BPR

06 – Bearish & Bullish Engulfing

07 – Example Trade 1

08 – Example Trade 2

DAILY HTF

4H HTF

15MIN LTF

PDH & PDL Previous Daily High & Previous Daily Low

PDH and PDL mark the previous day's highest and lowest prices, often used as key liquidity and support/resistance levels. These levels hold liquidity because traders often place stop-loss orders and breakout entries just above the PDH and below the PDL.

FVG (Fair Value Gap)

An FVG (Fair Value Gap) is an imbalance created when price moves aggressively, leaving an area with little trading activity.

It forms across 3 candles, where Candle 1 and Candle 3 don't overlap.

Price often comes back into the FVG to rebalance before continuing.

BPR (Balanced Price Range)

A BPR (Balanced Price Range) forms when a bullish FVG and a bearish FVG overlap.

That overlapping area shows where price has traded through aggressively in both directions, creating a more balanced zone.

When price returns to the BPR, traders often watch it as a potential support/resistance or entry area, especially when it aligns with the overall market bias.

Bearish & Bullish Engulfing

A bullish or bearish engulfing candle is a strong reversal signal where one candle's body completely covers the body of the previous candle.

Bullish engulfing: a strong bullish candle engulfs the previous bearish candle, showing buyers have taken control.

Bearish engulfing: a strong bearish candle engulfs the previous bullish candle, showing sellers have taken control. They're stronger when they happen at an important area like liquidity, an FVG, support/resistance, or a key high/low.

BEARISH ENGULFING

BULLISH ENGULFING

Trade : Example 1

Here we can see that price took the previous daily high. From there, it's important to understand the sessions. Did we also take the previous Asia high or London high? Did price tap into a key level such as an FVG, BPR, Order Block, institutional level, or another important liquidity area?

If yes, we can move down to the 15-minute timeframe and look for confirmation, such as a strong bearish displacement followed by a bearish engulfing candle.

In this example, the market created both an FVG and a BPR. If price comes back into this area and shows clear rejection, we can consider it a potential short opportunity.

Trade : Example 2

Here we can see the same concept in a bullish scenario. Price takes the previous daily low, and on the 5-minute timeframe we can see a strong bullish engulfing candle, created by a clear 1-minute bullish displacement.

From there, a potential entry can be found when price retraces back into the FVG, looking for continuation to the upside.

This is a simple entry model that starts with higher-timeframe liquidity and works down to the lower timeframes.

The goal is not only to find an entry based on liquidity, but also to use momentum, displacement and engulfing candles to potentially turn a scalp into an intraday or even swing trade.
